Theoretical and methodological aspects of the integral valuation of the institutional environment of innovative activity

The article determines that methodological approaches to the integrated valuation of the institutional environment of innovative activity are characterized by complications. Attention is focused on the need to calculate that the structure of the institutional environment of innovative entrepreneurship reflects the close relationship of structural elements, where the central role load falls on the object-subject institutional composition of participants. A phased interpretation of the implementation of the institutional environment valuation procedure has been developed.

It is necessary to determine that the indicators of the institutional environment of innovative entrepreneurship are quite ramified, can change, supplement, and the methodology for their calculation can be improved. The presented distribution of institutions is the author's interpretation. A number of indicators of one institution may simultaneously or partially be included in other institutions. However, taking into account the limited statistical resource base, as well as the fact that the presented institutions are inherently a reflection of the sociocultural and economic development parameters, we will conditionally assume that in order to test the main provisions of the methodology, the list of institutions is considered sufficient for evaluating innovative systems.
