CONCEPTUAL MODEL FOR ENSURING STATE RESILIENCE BASED ON SUSTAINABLE DEVELOPMENT, NATIONAL SECURITY, AND INTERNATIONAL ECONOMIC INTEGRATION

The article examines the interrelationship between sustainable development, national security, and international economic integration as key components of ensuring state resilience under the conditions of contemporary global transformations. It is substantiated that the intensification of geopolitical instability, the digitalization of the global economy, the transformation of international production and logistics chains, as well as energy and climate challenges, necessitates a transition from fragmented responses to threats toward a comprehensive model of public governance focused on long-term resilience. The evolution of scientific approaches to the interpretation of security is analyzed, demonstrating that the modern understanding of security is based on the state's ability to function effectively and adapt to internal and external risks. The concept of sustainable security is explored as an approach that integrates economic, social, environmental, energy, human, and state security dimensions while emphasizing the preventive nature of public policy. The role of international economic integration as a factor in strengthening economic resilience, enhancing competitiveness, and diversifying foreign economic relations is identified. A conceptual model for ensuring state resilience is proposed, founded on the systematic integration of the principles of sustainable development, national security, and the international economy. The model encompasses a comprehensive analysis of multi-level threats, the establishment of an integrated information and analytical framework, and the application of scenario modeling and strategic forecasting to support evidence-based public decision-making. It is demonstrated that the implementation of the proposed approach will enhance the adaptability of public policy, strengthen economic and security resilience, facilitate Ukraine's more effective integration into the international economic environment, and improve its long-term competitiveness.

Keywords: state resilience; sustainable development; national security; international economic integration; economic resilience; public policy; scenario planning.
